

## LOWKEY app by Aaron C. and JessRose N.

LowKey is an app that lets you keep your notes private from anyone who may try to access the app with the wrong passcode. When you open the app, the first activity is the passcode screen. This is the MainActivity:

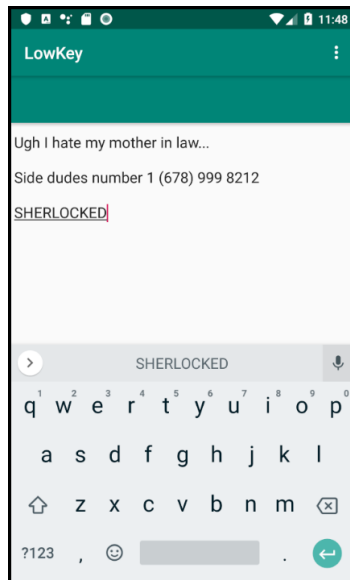

On first run, passcode is 0000.

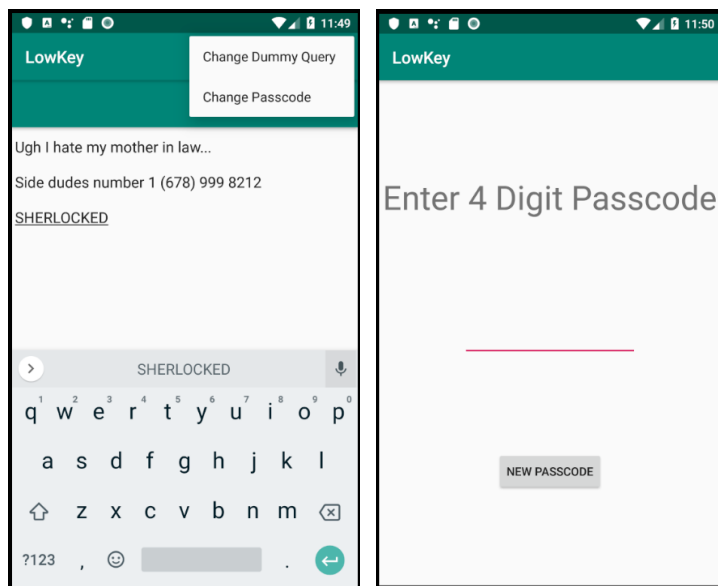

If you enter in the wrong Passcode then a new activity is opened. This activity scrapes craigslist using a query to trick the person into thinking you are hiding what you are shopping for (they will think that you are buying a gift for them).

If you enter the right passcode, then a notepad will open. This is where you enter in information that you want hidden/password protected on your device. This area is a text field that autosaves everything you type into shared preferences.

You can click the dropdown menu and hit “Change Passcode”. This will open a new activity that prompts the user to enter a 4 digit pin. If the pin is valid, then the app will return to the previous activity.

You can click the dropdown and click “Change query” to change what the scraper is searching for. This will change what the dummy activity looks like.
